The command unit determines then the desired torque and, by examining the engine operating regime and requirements of other systems airconditioning, traction control, ABS brake system and radiator vane, established the torque strategy, resulting in ignition angle, injection volume and throttle opening. The modular structure of software and hardware provides configurations specific for each vehicle. The electronic damper control increases the accuracy of the system, reducing consumption and improving drivability. The torquebased engine management facilitates integration with other vehicle systems. Also, duplicate sensors allow for total safety of operation. Without these cookies the website will not work properly. Please activate cookies and refresh your browser. After the refresh a cookie management dialog will be shown. The system is under the overall control of the Motronic M1.3 engine management system, which also controls the ignition timing. Ensure that the fault is not due to poor maintenance; ie, check that the air cleaner filter element is clean, the spark plugs are in good condition and correctly gapped, the valve clearances are correctly adjusted, the cylinder compression pressures are correct, the ignition timing is correct where adjustable, and that the engine breather hoses are clear and undamaged, referring to Chapters 1, 2 and 5 for further information. 2 If these checks fail to reveal the cause of the problem, carry out the checks and If problems still exist, the vehicle should be taken to a suitably equipped Peugeot dealer for testing. A wiring block connector is incorporated in the engine management circuit, into which a special electronic diagnostic tester can be plugged. The tester will locate the fault quickly and simply, alleviating the need to test all the system components individually, which is a timeconsuming operation that also carries a risk of damaging the ECU. The ignition timing must be correctly adjusted, as described in Chapter 5B.

5 Connect a vacuum gauge to the test point in the distributor vacuum advance line see illustration. 6 Check that the throttle movement is smooth. 7 With the engine stopped turn the air screw fully in see illustration. 8 Prise the tamperproof cap from the throttle stop screw see illustration. 9 Unscrew the throttle stop screw then retighten it until it just touches the throttle lever. Tighten the screw a

further four complete turns. 10 Start the engine and allow it to idle. Turn the throttle stop screw to obtain an idle speed of 650 rpm XU5J engines or 600 rpm XU5JA and XU9JA engines. Check that the vacuum reading shown on the gauge does not exceed 50 mm Hg 65 mbar and if necessary adjust the throttle stop screw. 11 Now turn the air screw in the throttle housing as necessary to obtain the specified idling speed. 12 Stop the engine and adjust the throttle switch, as described below. Adjustment should be entrusted to a Peugeot dealer. If not, repeat the procedure in paragraph 19. 22 Remove the feeler blade. The internal contacts should close and the ohmmeter reading be zero. 24 If the switch does not operate correctly it should be renewed. The ohmmeter should read zero. 30 Operate the throttle linkage, and the ohmmeter should read infinity. 31 If the readings are not correct, repeat the procedure described in paragraphs 26 to 30 inclusive. 32 Connect the ohmmeter between switch terminals 3 and 18. The ohmmeter should read infinity. 33 Fully open the throttle, and the ohmmeter should read zero. 34 If the specified readings cannot be obtained, renew the switch. 35 Reconnect the switch wiring plug on completion. Ensure that the working area is clean before removing the injectors, and ensure that no dirt is allowed to enter the system during the procedure. No attempt should be made to overhaul the injectors. If a fault or contamination is suspected, seek specialist advice. 1 Disconnect the battery negative lead.

2 Disconnect the wiring plugs from the fuel injectors, labelling them if necessary to ensure correct refitting. 3 Disconnect the vacuum hose from the top of the fuel pressure regulator. 4 Unscrew the four bolts securing the fuel rail to the inlet manifold two upper bolts, and two bolts at the righthand end of the rail, then Be prepared for fuel spillage, and take adequate precautions. 6 Refitting is a reversal of removal, but fit new injector Orings. Ensure that the working area is clean and that no dirt is allowed to enter the system during the procedure. 7 For improved access to the lower pressure regulator securing nut, proceed as described in paragraphs 3 and 4. 8 If not already done, disconnect the vacuum hose from the top of the pressure regulator. 9 Slacken the hose clip, and disconnect the fuel return hose from the bottom of the pressure regulator. Be prepared for fuel spillage, and take adequate precautions. 10 Unscrew the two bolts securing the pressure regulator to the fuel rail bracket assembly, whilst counter holding the nuts. Note that on some models, a hose bracket is secured by the upper bolt. Remove the throttle cable bracket from the top throttle housing securing stud, noting its orientation. 23 Withdraw the throttle housing from the inlet manifold. 24 Refitting is a reversal of removal, bearing in mind the following points. Disconnect the wiring. 27 Unscrew the supplementary air device bracket nuts and disconnect the wiring. 28 Tilt the assembly and coolant outlet housing without disconnecting the coolant hoses and remove the concealed mounting bolt. 29 Disconnect the air hoses, then remove the remaining mounting bolt and withdraw the unit. 30 Refitting is a reversal of removal. Make identification marks on the hoses to ensure that they are connected correctly on refitting. 6 Bearing in mind the information given in Section 4, slacken the retaining clips and disconnect the fuel feed and return hoses from the fuel rail.

7 Depress the retaining tangs and disconnect the wiring connectors from the four injectors. Free the wiring from any relevant retaining clips and position it clear of the manifold. 8 Where necessary, undo the retaining bolts and remove the support bracket from the underside of the manifold. 9 Undo the manifold retaining nuts and withdraw the manifold from the engine.
